

## Warmup

analytic topology  $T_{\{an\}}$  on  $\mathbb{R}^n$ :

$U \subset \mathbb{R}^n$  is in  $T_{\{an\}}$  iff

for all  $x$  in  $U$  there exists  $\delta > 0$  s.t.  $B(x, \delta) \subset U$

equivalently (when  $n = 1$ )

for all  $x$  in  $U$ , there exist  $a, b$  s.t.  $x \in (a, b) \subset U$

Df lower-limit topology  $T_\ell$  on  $\mathbb{R}$ :

$U \subset \mathbb{R}$  is in  $T_\ell$  iff

for all  $x$  in  $U$ , there exists  $b$  s.t.  $[x, b) \subset U$

Q1 is  $T_\ell$  a topology on  $\mathbb{R}$ ? [yes]

Q2 is  $T_\ell$  coarser than  $T_{\{an\}}$ ? finer?  
incomparable?

Prop  $T_\ell$  is strictly finer than  $T_{\{an\}}$

Pf  $T_\ell$  is finer than  $T_{\{an\}}$ :  
suppose  $U$  analytic open in  $\mathbb{R}$   
suppose  $x \in U$   
pick  $a < b$  s.t.  $x \in (a, b) \subset U$   
then  $[x, b) \subset (a, b)$

strict because  $[0, 1)$  in  $T_\ell$  but not in  $T_{\{an\}}$

$T_{\{indisc\}} < T_f < T_{\{an\}} < T_\ell < T_{\{disc\}}$

(Munkres §18, 16) recall from real analysis:

$f : \mathbb{R}^n \rightarrow \mathbb{R}^m$  is Bolzano continuous iff

for all  $x$  in  $\mathbb{R}^n$  and  $\varepsilon > 0$ , there exists  $\delta > 0$  s.t.  
 $|x - x'| < \delta$  implies  $|f(x) - f(x')| < \varepsilon$

equivalently

for all  $x$  in  $\mathbb{R}^n$  and  $\varepsilon > 0$ , there exists  $\delta > 0$  s.t.  
 $x' \in B(x, \delta)$  implies  $f(x') \in B(f(x), \varepsilon)$

equivalently

for all  $x$  in  $\mathbb{R}^n$  and  $\varepsilon > 0$ , there exists  $\delta > 0$  s.t.  
 $f^{-1}(B(f(x), \varepsilon))$  contains  $B(x, \delta)$

Goal      generalize this notion

given topological spaces  $(X, T_X)$  and  $(Y, T_Y)$ :

Df          a function  $f : X \rightarrow Y$  is continuous iff  
 $V$  open in  $Y$  implies  $f^{-1}(V)$  open in  $X$

Thm         $f : \mathbb{R}^n \rightarrow \mathbb{R}^m$  is Bolzano cts  
iff  
 $f$  is cts wrt the analytic topologies

Pf

suppose  $f$  cts wrt analytic topologies:

fix  $x$  in  $\mathbb{R}^n$  and  $\varepsilon > 0$

$B(f(x), \varepsilon)$  is open in  $\mathbb{R}^m$

so  $f^{-1}(B(f(x), \varepsilon))$  is open in  $\mathbb{R}^n$

so  $B(x, \delta) \subset f^{-1}(B(f(x), \varepsilon))$  for some  $\delta > 0$

suppose  $f$  Bolzano cts:

fix  $V$  anylytc open in  $\mathbb{R}^m$

want  $f^{-1}(V)$  anylytc open in  $\mathbb{R}^n$

suppose  $x$  in  $f^{-1}(V)$

can find  $\varepsilon > 0$  s.t.  $B(f(x), \varepsilon) \subset V$

then  $f^{-1}(B(f(x), \varepsilon)) \subset f^{-1}(V)$

pick  $\delta > 0$  s.t.  $B(x, \delta) \subset f^{-1}(B(f(x), \varepsilon))$

then  $x$  in  $B(x, \delta) \subset f^{-1}(V)$

Ex      which maps are continuous?

$f : (\mathbb{R}, T_\ell) \rightarrow (\mathbb{R}, T_{\text{an}})$ ,       $f(x) = x$     [yes]

$f : (\mathbb{R}, T_{\text{an}}) \rightarrow (\mathbb{R}, T_\ell)$ ,       $f(x) = x$     [no:  $[0, 1]$ ]

$f : (\mathbb{R}, T_{\text{an}}) \rightarrow (\mathbb{R}, T_\ell)$ ,       $f(x) = 31$     [yes]

### General Facts

1)     $S$  finer than  $T$ :

$\text{id} : (X, S) \rightarrow (X, T)$  continuous

2)     $S$  strictly coarser than  $T$ :

$\text{id} : (X, S) \rightarrow (X, T)$  not continuous

3)    constant maps are always continuous

also

4)    compositions of cts maps are cts

henceforth omit  $T$  from  $(X, T)$  when understood

Df        cts  $f : X$  to  $Y$  is a homeomorphism iff  
            it has a two-sided cts inverse  $g : Y$  to  $X$   
            i.e.  $g(f(x)) = x$  for all  $x$  in  $X$ ,  
                 $f(g(y)) = y$  for all  $y$  in  $Y$

“what is shape?”

“ $X$  and  $Y$  have the same shape  
when there is a homeo between them”

Ex         $\text{id} : (X, T)$  to  $(X, T)$  is always a homeo  
            with inverse  $\text{id}$

Ex        [however:]  
            a cts bijection need not be a homeo

[we already have an example! which?]  
 $f : (\mathbb{R}, T_\ell)$  to  $(\mathbb{R}, T_{\{an\}})$ ,      $f(x) = x$

Ex        more homeo's in the analytic topology:

$f : \mathbb{R}$  to  $\mathbb{R}$ ,                     $f(x) = x^3$   
 $f : \mathbb{R}^2$  to  $\mathbb{R}^2$                  $f(x, y) = (x + y, (x - y)^3)$

[compositions of homeo's are homeo's]

Q        is there a homeo  $\mathbb{R}$  to  $\mathbb{R}^2$ ? vice versa?

The Subspace Topology      fix  $A$  sub  $X$

Df            the subspace topology on  $A$   
                 induced by  $X$ :

$U$  sub  $A$  is open iff there exists  $V$  open in  $X$  s.t.  
 $U = V \cap A$

Ex             $X = \mathbb{R}$  and  $A = [0, \infty)$

suppose  $0 \leq a < b$

$(a, b)$ open in $[0, \infty)$ ? in $\mathbb{R}$ ?	[yes, yes]
$[0, b)$ open in $[0, \infty)$ ? in $\mathbb{R}$ ?	[yes, no]
$[a, b)$ open in $[0, \infty)$ ?	[no, no]

[moral: to say “ $U$  is open”, must clarify “where”]

Prop            the subspace topology on  $A$  is  
                 the (unique) coarsest topology s.t.  
                 the inclusion  $i : A$  to  $X$  is continuous

Pf            easy that  $i : A$  to  $X$  cts wrt sub. topology

suppose  $i : A$  to  $X$  cts wrt some topology  $T$  on  $A$   
fix  $U$  open in subspace topology on  $A$   
want  $U$  in  $T$

$U = V \cap A$  for some  $V$  open in  $X$   
so  $U = i^{-1}(V)$  in  $T$  by continuity of  $i$  wrt  $T$
