

## Warmup

Df  $X$  is Hausdorff iff, for all  $x \neq y$  in  $X$ ,  
there are disjoint opens  $U, V$  s.t.  
 $x$  in  $U$  and  $y$  in  $V$

in which topologies is  $\mathbb{R}$  Hausdorff?

analytic [yes]

discrete [yes]

indiscrete [no]

finite complement [no]

$T_1$  [yes]

[we build more non-Hausdorff spaces by gluing]

Ex let  $X = \mathbb{R} \times \{a, b\}$  in the analytic top

let  $\sim$  be the equivalence relation on  $X$  where:

- 1)  $\sim$  is reflexive and symmetric
- 2)  $(x, a) \sim (x, b)$  for all  $x \neq 0$
- 3)  $(0, a) \not\sim (0, b)$

let  $A = X/\sim$ , the corresponding quotient space  
then points of  $A$  can be labeled:

$x$  for real  $x \neq 0$

$(0, a), (0, b)$

[draw picture]

[what are some open sets in  $A$  containing  $(0, a)$ ?]

$A$  is not Hausdorff because of  $(0, a)$  and  $(0, b)$

(Munkres §17, 21) for  $A \text{ sub } X$ , recall:

interior  $\text{Int}_X(A)$

$= \{a \text{ in } A \mid \text{have open } U \text{ s.t. } a \text{ in } U \text{ sub } A\}$

[largest open set of  $X$  contained inside  $A$ ]

closure  $\text{Cl}_X(A)$

$= X - \text{Int}_X(X - A)$  [unpack this]

$= X - \{x \mid \text{have open } U \text{ s.t. } x \text{ in } U \text{ sub } X - A\}$

$= \{x \text{ in } X \mid \text{for all open } U \text{ ni } x, U \text{ intersects } A\}$

[smallest closed set of  $X$  containing  $A$ ]

$\text{Int}(A) \text{ sub } A \text{ sub } \text{Cl}(A)$

Rem suffices to check conditions on a basis

[Int does not play well with subspaces]

Ex

let  $X = \text{analytic } \mathbb{R}$  and  $A = [0, 1]$

$\text{Int}_X(A) = (0, 1)$

$\text{Int}_A(A) = [0, 1]$

[nonetheless:]

Prop

for any  $Y \text{ sub } X$ , still true that

$\text{Int}_Y(A \cap Y) \supseteq \text{Int}_X(A) \cap Y$

Pf

$\text{Int}_X(A)$  open in  $X$

so  $\text{Int}_X(A) \cap Y$  open in  $Y$

but also  $A \cap Y \text{ subset } \text{Int}_X(A) \cap Y$

so  $\text{Int}_Y(A \cap Y) \supseteq \text{Int}_X(A) \cap Y$

Cor for any  $Y \text{ sub } X$ , true that  
 $Cl_Y(A \text{ cap } Y) \text{ sub } Cl_X(A) \text{ cap } Y$

Pf let  $B = X - A$   
 $Cl_X(A) = X - Int_X(B)$   
 $Cl_X(A) \text{ cap } Y = Y - (Int_X(B) \text{ cap } Y)$   
 $Cl_Y(A \text{ cap } Y) = Y - Int_Y(B \text{ cap } Y)$

thus  $Cl_Y(A \text{ cap } Y) \text{ sub } Cl_X(A) \text{ cap } Y$

[further case where  $Cl$  does not play well with  $\text{sub}$ ]

Ex let  $X = \text{analytic } \mathbb{R}$  and  $Y = [0, 1]$   
let  $A = (1, 2)$   
 $Cl_Y(A \text{ cap } Y) = \emptyset$   
 $Cl_X(A) \text{ cap } Y = \{1\}$

[another salvage:] Munkres Thm 17.4:

Thm if  $A \text{ sub } Y$ , then get equality:  
 $Cl_Y(A) = Cl_X(A) \text{ cap } Y$

Rem no analogous thm for  $Int$ !:  
saw that in general,  $Int_A(A) \neq Int_X(A)$

Pf remains to show  
 $Cl_Y(A) \text{ supset } Cl_X(A) \text{ cap } Y$

pick  $y$  in  $Cl_X(A) \text{ cap } Y$   
want to show  $y$  in  $Cl_Y(A)$ : i.e.,  
any open  $V \text{ sub } Y$  containing  $y$  intersects  $A$   
know  $V = U \text{ cap } Y$  for some open  $U \text{ sub } X$   
but  $U$  intersects  $A$ , and  $A \text{ sub } Y$ , so  $V$  intersects  $A$   $\square$

## Summary

- 1)  $\text{Int}_Y(A \cap Y) \supseteq \text{Int}_X(A) \cap Y$
- 2)  $\text{Cl}_Y(A \cap Y) \subseteq \text{Cl}_X(A) \cap Y$
- 3) if  $A \subseteq Y$ , then  $\text{Cl}_Y(A) = \text{Cl}_X(A) \cap Y$

Df we say  $x$  is a limit point of  $A$  in  $X$  iff  
 $x \in \text{Cl}_X(A - \{x\})$

equivalently, every open set of  $X$  containing  $x$   
intersects  $A$  in a point distinct from  $x$

Df we say  $x_1, x_2, \dots$  converges to  $x$  iff,  
for all open  $U$  containing  $x$ ,  
there is  $N$  s.t.  $x_n \in U$  for all  $n \geq N$

Ex  $X = \mathbb{R}$  and  $K = \{1/n \mid n = 1, 2, 3, \dots\}$   
[draw picture]

$\text{Cl}_X(K) = \{0\} \cup K$ ;  $0$  is the only limit point

Ex  $X = \mathbb{R}$  and  $I = [0, 1]$   
[draw picture]

$\text{Cl}_X(I) = I$ ; every point of  $I$  is a limit point

Thm in general,  
 $\text{Cl}_X(A) = A \cup \{\text{limit points of } A \text{ in } X\}$

Pf boring

Q how does our intuition for limit pts fail beyond the analytic topology?

Ex recall  $X = \mathbb{R} \times \{a, b\}$  and  $A = X/\sim$   
where  $(x, a) \sim (x, b)$  for all  $x \neq 0$   
[draw picture]

here a sequence of pts can converge to  
two distinct limit pts simultaneously

[the Hausdorff condition rules this out]

Thm if  $X$  is Hausdorff  
then a sequence of pts in  $X$  converges  
to at most one limit pt

Pf suppose  $(x_n)_n$  converges to  $x$

want to show:

if  $y \neq x$ , then  $(x_n)_n$  cannot converge to  $y$   
pick disjoint open  $U, V$  s.t.  $x \in U$  and  $y \in V$   
then there is  $N$  s.t.  $n \geq N$  forces  $x_n \in U$   
hence  $n \geq N$  forces  $x_n \notin V$

### Hierarchy of Separation Conditions

Hausdorff for all  $x \neq y$ , disjoint open  $U, V$  s.t.  
 $x \in U$  and  $y \in V$

$T_1$  for all  $x \neq y$ , open  $U$  s.t.  
 $x \in U$  and  $y \notin U$

$T_0$  for all  $x \neq y$ , have open  $U$  s.t.  
either  $x \in U, y \notin U$  or vice versa

Ex  $T_0$  but not  $T_1$ :

Munkres Thm 17.9:

Thm if  $X$  is  $T_1$  and  $A \subseteq X$   
then  $x$  is a limit point of  $A$  iff  
every open  $U$  containing  $x$  contains  
infinitely many points of  $A$
